This form is a summary description of the model entitled “Reader/Writer Mutual Exclusion” proposed for the Model Checking Contest @ Petri Nets. Models can be given in several instances parameterized by scaling parameters. Colored nets can be accompanied by one or many equivalent, unfolded P/T nets. Models are given together with property files (possibly, one per model instance) giving a set of properties to be checked on the model.

Description

The net models a system with readers and writers. Reading can be conducted concurrently whereas writing has to be done exclusively. This is modeled by a number of semaphores (one for each reader) that need to be collected by a writer prior to writing.

Net formalism: This submission contains unfolded versions of the net for a variety of scaling parameters. These nets are given in LoLA low-level format and PNML. The original net has been modeled as an algebraic Petri net in LoLA high-level format, see http://service-technology.org/files/lola/lola.pdf.

The model is sketched in the figure. The two sorts $R$ and $W$ model the number of readers and writers, respectively.

Structural properties

ordinary — all arcs have multiplicity one (a)

simple free choice — all (different) transitions with a shared input place have no other input place (b)

state machine — every transition has exactly one input place and exactly one output place (c)

marked graph — every place has exactly one input transition and exactly one output transition (d)

connected — there is an undirected path between every two nodes (places or transitions) (e)

strongly connected — there is a directed path between every two nodes (places or transitions) (f)

source place(s) — one or more places have no input transitions (g)

sink place(s) — one or more places have no output transitions (h)

source transition(s) — one or more transitions have no input places (i)

sink transition(s) — one or more transitions have no output places (j)

loop-free — no transition has an input place that is also an output place (k)

conservative — for each transition, the number of input arcs equals the number of output arcs (l)

subconservative — for each transition, the number of input arcs equals or exceeds the number of output arcs (m)

nested units — places are structured into hierarchically nested sequential units (n)

Behavioural properties

safe — in every reachable marking, there is no more than one token on a place (o)

deadlock — there exists a reachable marking from which no transition can be fired (p)

reversible — from every reachable marking, there is a transition path going back to the initial marking (q)

quasi-live — for every transition $t$, there exists a reachable marking in which $t$ can fire (r)

(a) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(b) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(c) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(d) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(e) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(f) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(g) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(h) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(i) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(j) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(k) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(l) stated by CÆSAR.BDD version 1.7 on all 12 instances (see aforementioned parameter values).

(m) the definition of Nested-Unit Petri Nets (NUPN) is available from [http://mcc.1lp6.fr/nupn.php](http://mcc.1lp6.fr/nupn.php)

(n) stated by CÆSAR.BDD version 2.0 to be true on 7 instance(s) out of 12, and unknown on the remaining 5 instance(s); confirmed at MCC’2014 by Cunf, Lola, and Tapaal on all 12 instances, and by GreatSPN on fewer instances.

(o) stated by CÆSAR.BDD version 2.0 to be false on 7 instance(s) out of 12, and unknown on the remaining 5 instance(s).
live — for every transition \( t \), from every reachable marking, one can reach a marking in which \( t \) can fire

Other properties

A mutual exclusion violation (two concurrent writers) can be checked using a CTL formula like

\[
\forall i \neq j: \text{EF} (\text{wri}.i \land \text{wri}.j)
\]

This formula is given for the unfolded low-level models.
