This form is a summary description of the model entitled "SmallOperatingSystem" proposed for the Model Checking Contest @ Petri Nets. Models can be given in several instances parameterized by scaling parameters. Colored nets can be accompanied by one or many equivalent, unfolded P/T nets. Models are given together with property files (possibly, one per model instance) giving a set of properties to be checked on the model.

Description

This Petri net models a simplified Operating System handling the execution of tasks on a machine with several so-called "memory segments", Disk controller units, and cores. The typical lifecycle of a task is the following:

- 1 A ask is loaded from disk to memory (requires a segment and a disk controller),
- 2 When the task is ready to execute, it can get a core, be suspended and get a core again as long as its execution is not finished. It can also be removed from the memory if some is needed otherwise
- 3 When the execution finishes, the task is saved back on the disk.

The system has several scaling parameters: M (memory segments), T (tasks), D (Disk controllers) and C (cores). However, to simplify this in the MCC, we reduce it to two parameters, MT and DC with the following correspondence: M = T = MT, D = DC and $C = 2 \times DC$.

Graphical representation for MT16 and DC = 8

Scaling parameter

Origin: Academic

Parameter name	Parameter description	Chosen parameter values		
MT and DC	MT to compute available tasks and mem-	(MT=16, DC=8), (MT=32, DC=8), (MT=32,		
	ory and DC to compute available disk con-	DC=16), (MT=64, DC=16), (MT=64, DC=32),		
	trollers and cores	(MT=128, DC=32), (MT=128, DC=64),		
		(MT=256, DC=64), (MT=256, DC=128),		
		(MT=512, DC=128), (MT=512, DC=256),		
		(MT=1024, DC=256), (MT=1024, DC=512),		
		(MT=2048, DC=512), (MT=2048, DC=1024),		
		(MT=4096, DC=1024), (MT=4096, DC=2048),		
		(MT=8192, DC=2048), (MT=8192, DC=4096)		

Size of the model

Although the model is parameterized, its size does not depend on parameter values.

number of places: 9 number of transitions: 8 number of arcs: 27

Structural properties

ordinary — all arcs have multiplicity one	
	X (a)
	X (b)
	X (c)
	X (d)
connected — there is an undirected path between every two nodes (places or transitions)	/ (e)
strongly connected — there is a directed path between every two nodes (places or transitions)	(f)
source place(s) — one or more places have no input transitions	X (g)
sink place(s) — one or more places have no output transitions	X (h)
source transition(s) — one or more transitions have no input places	X (i)
sink transitions(s) — one or more transitions have no output places	X (j)
loop-free — no transition has an input place that is also an output place	(k)
conservative — for each transition, the number of input arcs equals the number of output arcs	X (1)
subconservative — for each transition, the number of input arcs equals or exceeds the number of output arcs	(m)
nested units — places are structured into hierarchically nested sequential units (n)	X

⁽a) 9 arcs are not simple free choice, e.g., the arc from place "TaskOnDisk" (which has 2 outgoing transitions) to transition "startLoading" (which has 3 input places).

⁽b) transitions "startLoading" and "startUnload" share a common input place "TaskOnDisk", but only the former transition has input place "FreeMemSegment".

⁽c) 7 transitions are not of a state machine, e.g., transition "startLoading".

⁽d) 6 places are not of a marked graph, e.g., place "TaskOnDisk".

⁽e) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

⁽f) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

⁽g) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

⁽h) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

⁽i) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

⁽j) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

⁽k) stated by CÆSAR.BDD version 2.6 on all 19 instances ((MT=16, DC=8), (MT=32, DC=8), etc.).

^{(1) 7} transitions are not conservative, e.g., transition "startLoading".

⁽m) 3 transitions are not subconservative, e.g., transition "endLoading".

⁽n) the definition of Nested-Unit Petri Nets (NUPN) is available from http://mcc.lip6.fr/nupn.php

Type: P/T Net Origin: Academic

Behavioural properties

safe — in every reachable marking, there is no more than one token on a place	(o
deadlock — there exists a reachable marking from which no transition can be fired	. X
reversible — from every reachable marking, there is a transition path going back to the initial marking	
quasi-live — for every transition t, there exists a reachable marking in which t can fire	(p
live — for every transition t, from every reachable marking, one can reach a marking in which t can fire	

Size of the marking graphs

Parameter	Number of reach-	Number of tran-	Max. number of	Max. number of
	able markings	sition firings	tokens per place	tokens per marking
MT=16, DC=8	16 587 ^(q)	100 896 ^(r)	?	$\geq 56^{\text{(s)}}$
