This form is a summary description of the model entitled "Parking" proposed for the Model Checking Contest @ Petri Nets. Models can be given in several instances parameterized by scaling parameters. Colored nets can be accompanied by one or many equivalent, unfolded P/T nets. Models are given together with property files (possibly, one per model instance) giving a set of properties to be checked on the model.

Description

This collection of P/T nets was derived from the formal specification of a car parking control system. The parking lot is divided into several areas. The accesses to each area are controlled by a set of PLCs (*Programmable Logic Controllers*), which monitor the availability in real-time, and direct cars entering the parking to the area with the highest availability if the requested area is fully occupied. For each area, there is one *master* PLC that supervises several so-called *slave* PLCs. The PLCs communicate via a MODBUS network and the whole system can be considered as a GALS (*Globally Asynchronous, Locally Synchronous*) system.

The parking system was formally described in GRL, a specification language dedicated to PLCs and GALS. Each GRL specification was automatically translated to LNT (*LOTOS New Technology*), then to LOTOS, and then to an interpreted Petri net using the CADP toolbox. Finally, a P/T net was obtained by stripping out all dataflow-related information (variables, types, assignments, guards, etc.) from the interpreted Petri net, leading to a NUPN (*Nested-Unit Petri Net*) model translated to PNML using the CÆSAR.BDD tool.

Scaling parameter

Parameter name	Parameter description	Chosen parameter values
(M, S)	M: number of master PLCs, S: number of slave PLCs	$(1,4)$, $(2,8)$, $(4,16)$, $(8,32)$, $(4,32)$, $(8,64)$

Size of the model

Parameter	Number of places	Number of transitions	Number of arcs	Number of units	HWB code
$(1,4)$	65	97	284	16	2–15–42
$(2,8)$	137	201	593	33	2–32–87
$(4,16)$	305	433	1289	73	2–72–193
$(4,32)$	529	785	2329	121	2–120–321
$(8,32)$	737	993	2993	177	2–176–449
$(8,64)$	1185	1697	5073	273	2–272–713

Structural properties

ordinary — *all arcs have multiplicity one* ..... ✔
simple free choice — *all transitions sharing a common input place have no other input place* ..... ✗ [a]
extended free choice — *all transitions sharing a common input place have the same input places* ..... ✗ [b]

[a] stated by CÆSAR.BDD version 2.2 on all the 6 instances.
[b] stated by CÆSAR.BDD version 2.6 on all 6 instances.

Jingyan Jourdan-Lu and Eric Léo
jingyan.jourdan-lu@inria.fr

state machine — *every transition has exactly one input place and exactly one output place* ..... ✗ (c)
marked graph — *every place has exactly one input transition and exactly one output transition* ..... ✗ (d)
connected — *there is an undirected path between every two nodes (places or transitions)* ..... ✓ (e)
strongly connected — *there is a directed path between every two nodes (places or transitions)* ..... ✗ (f)
source place(s) — *one or more places have no input transitions* ..... ✓ (g)
sink place(s) — *one or more places have no output transitions* ..... ✗ (h)
source transition(s) — *one or more transitions have no input places* ..... ✗ (i)
sink transitions(s) — *one or more transitions have no output places* ..... ✗ (j)
loop-free — *no transition has an input place that is also an output place* ..... ✗ (k)
conservative — *for each transition, the number of input arcs equals the number of output arcs* ..... ✗ (l)
subconservative — *for each transition, the number of input arcs equals or exceeds the number of output arcs* ..... ✗ (m)
nested units — *places are structured into hierarchically nested sequential units* (n) ..... ✓

Behavioural properties

safe — *in every reachable marking, there is no more than one token on a place* ..... ✓ (o)
deadlock — *there exists a reachable marking from which no transition can be fired* ..... ✓ (p)
reversible — *from every reachable marking, there is a transition path going back to the initial marking* ..... ✗ (q)
quasi-live — *for every transition t, there exists a reachable marking in which t can fire* ..... ✓ (r)
live — *for every transition t, from every reachable marking, one can reach a marking in which t can fire* ..... ✗ (s)

Size of the marking graphs

Parameter	Number of reachable markings	Number of transition firings	Max. number of tokens per place	Max. number of tokens per marking
$(1, 4)$	31745 (t)	?	1 (u)	15 (v)
$(2, 8)$	4.5676E+09 (w)	?	1 (x)	32 (y)
$(4, 16)$	8.44047E+21 (z)	?	1 (aa)	72 (ab)
$(8, 32)$	$\geq$ 5.71544E+44 (ac)	?	1 (ad)	176 (ae)
$(4, 32)$	3.67025E+32 (af)	?	1 (ag)	120 (ah)
$(8, 64)$	$\geq$ 6.2771E+65 (ai)	?	1 (aj)	272 (ak)
