

This form is a summary description of the model entitled "Reader/Writer Mutual Exclusion" proposed for the Model Checking Contest @ Petri Nets. Models can be given in several instances parameterized by scaling parameters. Colored nets can be accompanied by one or many equivalent, unfolded P/T nets. Models are given together with property files (possibly, one per model instance) giving a set of properties to be checked on the model.

Description

The net models a system with readers and writers. Reading can be conducted concurrently whereas writing has to be done exclusively. This is modeled by a number of semaphores (one for each reader) that need to be collected by a writer prior to writing.

Net formalism: This submission contains unfolded versions of the net for a variety of scaling parameters. These nets are given in LoLA low-level format and PNML. The original net has been modeled as an algebraic Petri net in LoLA high-level format, see <http://service-technology.org/files/lola/lola.pdf>.

The model is sketched in the figure. The two sorts R and W model the number of readers and writers, respectively.

Scaling parameter

Parameter name	Parameter description	Chosen parameter values
(readers r , writers w)	see description	(10,10), (10,20), (10,50), (10,100), (10,500), (10,1000), (10,2000), (20,10), (100,10), (500,10), (1000,10), (2000,10)

Size of the model

Parameter	Number of places	Number of transitions	Number of arcs
$(r, w) = (10, 10)$	50	40	300
$(r, w) = (10, 20)$	70	60	540
$(r, w) = (10, 50)$	130	120	1260
$(r, w) = (10, 100)$	230	220	2460
$(r, w) = (10, 500)$	1030	1020	12060
$(r, w) = (10, 1000)$	2030	2020	24060
$(r, w) = (10, 2000)$	4030	4020	48060
$(r, w) = (20, 10)$	80	60	560
$(r, w) = (100, 10)$	320	220	2640
$(r, w) = (500, 10)$	1520	1020	13040
$(r, w) = (1000, 10)$	3020	2020	26040
$(r, w) = (2000, 10)$	6020	4020	52040

Structural properties

ordinary — all arcs have multiplicity one	✓
simple free choice — all transitions sharing a common input place have no other input place	✗ (a)
extended free choice — all transitions sharing a common input place have the same input places	✗ (b)
state machine — every transition has exactly one input place and exactly one output place	✗ (c)
marked graph — every place has exactly one input transition and exactly one output transition	✗ (d)
connected — there is an undirected path between every two nodes (places or transitions)	✓ (e)
strongly connected — there is a directed path between every two nodes (places or transitions)	✓ (f)
source place(s) — one or more places have no input transitions	✗ (g)
sink place(s) — one or more places have no output transitions	✗ (h)
source transition(s) — one or more transitions have no input places	✗ (i)
sink transitions(s) — one or more transitions have no output places	✗ (j)
loop-free — no transition has an input place that is also an output place	✓ (k)
conservative — for each transition, the number of input arcs equals the number of output arcs	✗ (l)
subconservative — for each transition, the number of input arcs equals or exceeds the number of output arcs	✗ (m)
nested units — places are structured into hierarchically nested sequential units ⁽ⁿ⁾	✗

Behavioural properties

safe — in every reachable marking, there is no more than one token on a place	? (o)
deadlock — there exists a reachable marking from which no transition can be fired	✗ (p)
reversible — from every reachable marking, there is a transition path going back to the initial marking	✓

(a) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(b) stated by CÆSAR.BDD version 2.6 on all 12 instances (see all aforementioned parameter values).

(c) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(d) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(e) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(f) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(g) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(h) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(i) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(j) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(k) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(l) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(m) stated by CÆSAR.BDD version 1.7 on all 12 instances (see all aforementioned parameter values).

(n) the definition of Nested-Unit Petri Nets (NUPN) is available from <http://mcc.lip6.fr/nupn.php>

(o) stated by CÆSAR.BDD version 2.0 to be true on 7 instance(s) out of 12, and unknown on the remaining 5 instance(s).

(p) stated by CÆSAR.BDD version 2.0 to be false on 7 instance(s) out of 12, and unknown on the remaining 5 instance(s); confirmed at MCC'2014 by Cunf, Lola, and Tapaal on all 12 instances, and by GreatSPN on fewer instances.

quasi-live — for every transition t , there exists a reachable marking in which t can fire? ^(q)
live — for every transition t , from every reachable marking, one can reach a marking in which t can fire?

Size of the marking graphs

Other properties

A mutual exclusion violation (two concurrent writers) can be checked using a CTL formula like

$$\forall i \neq j: \mathbf{EF} (\text{wri}.i \wedge \text{wri}.j)$$

This formula is given for the unfolded low-level models.

^(ba) computed at MCC'2014 by GreatSPN.

^(bb) computed at MCC'2014 by GreatSPN.
