This form is a summary description of the model entitled “Solitaire” proposed for the Model Checking Contest @ Petri Nets. Models can be given in several instances parameterized by scaling parameters. Colored nets can be accompanied by one or many equivalent, unfolded P/T nets. Models are given together with property files (possibly, one per model instance) giving a set of properties to be checked on the model.

Description

Solitaire is a popular board game requiring non-obvious solution strategies; see [wiki] for the rules of the game. The objective of the Petri nets is to generate one/some/all strategies (paths) to reach a solution, i.e., a state where just one stone is left. The auxiliary place counter gives the current number of stones on the board; added to simplify the specification of the target state (any state with counter = 1). Solitaire is played on different boards; we give Petri nets for the most popular ones: square board (0), English board (1), French board (2), each in two versions: with/out counter [H05]. The existence of a solution may depend on the initially empty field; all initial markings have been chosen to enable a solution. Encoding this game as coloured Petri net would permit the generation of arbitrary boards of scalable size.

In March 2020, Pierre Bouvier and Hubert Garavel provided a decomposition of one instance of this model into a network of communicating automata. This network is expressed as a Nested-Unit Petri Net (NUPN) that can be found in the “toolspecific” section of the corresponding PNML file.

Structural properties

- **ordinary** — all arcs have multiplicity one
- **simple free choice** — all transitions sharing a common input place have no other input place
- **extended free choice** — all transitions sharing a common input place have the same input places
- **state machine** — every transition has exactly one input place and exactly one output place
- **marked graph** — every place has exactly one input transition and exactly one output transition
- **connected** — there is an undirected path between every two nodes (places or transitions)
- **strongly connected** — there is a directed path between every two nodes (places or transitions)
- **source place(s)** — one or more places have no input transitions
- **sink place(s)** — one or more places have no output transitions
- **source transition(s)** — one or more transitions have no input places
- **sink transition(s)** — one or more transitions have no output places
- **loop-free** — no transition has an input place that is also an output place
- **conservative** — for each transition, the number of input arcs equals the number of output arcs
- **subconservative** — for each transition, the number of input arcs equals or exceeds the number of output arcs
- **nested units** — places are structured into hierarchically nested sequential units

Behavioural properties

- **safe** — in every reachable marking, there is no more than one token on a place
- **dead place(s)** — one or more places have no token in any reachable marking

---

(a) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(b) stated by CESAR.BDD version 2.6 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(c) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(d) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(e) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(f) stated by CESAR.BDD version 2.0 to be false on all 3 instances with counters, and true on all 3 instances without counters.
(g) stated by CESAR.BDD version 2.0 to be true on all 3 instances with counters, and false on all 3 instances without counters.
(h) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(i) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(j) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(k) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(l) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(m) stated by CESAR.BDD version 2.0 on all 6 instances \((B \in \{0,1,2\}, \text{with and without counter})\).
(n) stated by CESAR.BDD version 3.3 to be true on 1 instance(s) out of 6, and false on the remaining 5 instance(s).
(o) the definition of Nested-Unit Petri Nets (NUPN) is available from [http://mcc.lip6.fr/nupn.php](http://mcc.lip6.fr/nupn.php).
(p) the nets corresponding to instances without counters are safe because they are covered with P-invariants having a single token in the initial place — found by CESAR.BDD version 3.3 to be true on 1 instance(s) out of 6, false on 3 instance(s), and unknown on the remaining 2 instance(s).
(q) stated by CESAR.BDD version 3.3 to be false on 3 instance(s) out of 6, and unknown on the remaining 3 instance(s).
dead transition(s) — one or more transitions cannot fire from any reachable marking ............................................. X
deadlock — there exists a reachable marking from which no transition can be fired ................................................. ✓ (c)
reversible — from every reachable marking, there is a transition path going back to the initial marking .................. X
live — for every transition \( t \), from every reachable marking, one can reach a marking in which \( t \) can fire ............................ X

Other properties

Deadlocks (dead states) which correspond to a solution can be identified by: sum over all places \( T_{i,j} = 1 \), or counter=0. All places are covered by 1-P-invariants, except the counter place. All nets enjoy some symmetries.

---

(s) special deadlocks (dead states) correspond to the solutions we are looking for; confirmed at MCC’2014 by Lola and Tapaal on all 6 instances.
(t) computed at MCC’2014 by Marcie, PNMC, and PNXDD; exact value: 16,998,428.
(u) computed at MCC’2014 by Marcie; exact value: 213,958,152.
(v) computed at MCC’2014 by Marcie and PNMC.
(w) number of initial tokens, because the net is sub-conservative.
(x) number of initial tokens, because the net is sub-conservative.
(y) number of initial tokens, because the net is sub-conservative.
(z) number of initial tokens, because the net is sub-conservative.
(aa) number of initial tokens, because the net is sub-conservative.
