This form is a summary description of the model entitled “Solitaire” proposed for the Model Checking Contest @ Petri Nets. Models can be given in several instances parameterized by scaling parameters. Colored nets can be accompanied by one or many equivalent, unfolded P/T nets. Models are given together with property files (possibly, one per model instance) giving a set of properties to be checked on the model.

Description

Solitaire is a popular board game requiring non-obvious solution strategies; see [wiki] for the rules of the game. The objective of the Petri nets is to generate one/some/all strategies (paths) to reach a solution, i.e., a state where just one stone is left. The auxiliary place counter gives the current number of stones on the board; added to simplify the specification of the target state (any state with counter = 1). Solitaire is played on different boards; we give Petri nets for the most popular ones: square board (0), English board (1), French board (2), each in two versions: with/out counter [H05]. The existence of a solution may depend on the initially empty field; all initial markings have been chosen to enable a solution. Encoding this game as coloured Petri net would permit the generation of arbitrary boards of scalable size.

In March 2020, Pierre Bouvier and Hubert Garavel provided a decomposition of one instance of this model into a network of communicating automata. This network is expressed as a Nested-Unit Petri Net (NUPN) that can be found in the “toolspecific” section of the corresponding PNML file.

General solitaire pattern for one field (left), and its composition to the 7 × 7 English board (right).

Structural properties

ordinary — all arcs have multiplicity one ................................................. ✓
simple free choice — all transitions sharing a common input place have no other input place .......................... ❌ (a)
extended free choice — all transitions sharing a common input place have the same input places .................. ❌ (b)
state machine — every transition has exactly one input place and exactly one output place ....................... ❌ (c)
marked graph — every place has exactly one input transition and exactly one output transition ..................... ❌ (d)
connected — there is an undirected path between every two nodes (places or transitions) ............................ ✓ (e)
strongly connected — there is a directed path between every two nodes (places or transitions) ..................? (f)
source place(s) — one or more places have no input transitions .........................................................? (g)
sink place(s) — one or more places have no output transitions .............................................................. (h)
source transition(s) — one or more transitions have no input places ...................................................... (i)
sink transition(s) — one or more transitions have no output places ....................................................... (j)
loop-free — no transition has an input place that is also an output place ............................................. ✓ (k)
conservative — for each transition, the number of input arcs equals the number of output arcs .................. ✓ (l)
subconservative — for each transition, the number of input arcs equals or exceeds the number of output arcs ................................. ✓ (m)
nested units — places are structured into hierarchically nested sequential units(n) .......................................? (n)

Behavioural properties

safe — in every reachable marking, there is no more than one token on a place ......................................? (p)
dead place(s) — one or more places have no token in any reachable marking ...........................................? (q)

(a) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(b) stated by CÆSAR.BDD version 2.6 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(c) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(d) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(e) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(f) stated by CÆSAR.BDD version 2.0 to be false on all 3 instances with counters, and true on all 3 instances without counters.
(g) stated by CÆSAR.BDD version 2.0 to be true on all 3 instances with counters, and false on all 3 instances without counters.
(h) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(i) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(j) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(k) stated by CÆSAR.BDD version 2.0 on all 6 instances (B ∈ {0, 1, 2}, with and without counter).
(l) stated by CÆSAR.BDD version 2.0 to be false on all 3 instances with counters, and true on all 3 instances without counters.
(m) stated by CÆSAR.BDD version 2.0 to be false on all 3 instances with counters, and true on all 3 instances without counters.
(n) the definition of Nested-Unit Petri Nets (NUPN) is available from http://mcc.1lp6.fr/nupn.php
(o) stated by CÆSAR.BDD version 3.3 to be true on 1 instance(s) out of 6, and false on the remaining 5 instance(s).
(p) the nets corresponding to instances without counters are safe because they are covered with P-invariants having a single token in the initial place — found by CÆSAR.BDD version 3.3 to be true on 1 instance(s) out of 6, false on 3 instance(s), and unknown on the remaining 2 instance(s).
(q) stated by CÆSAR.BDD version 3.3 to be false on 3 instance(s) out of 6, and unknown on the remaining 3 instance(s).
dead transition(s) — one or more transitions cannot fire from any reachable marking.

deadlock — there exists a reachable marking from which no transition can be fired.

reversible — from every reachable marking, there is a transition path going back to the initial marking.

live — for every transition t, from every reachable marking, one can reach a marking in which t can fire.

Other properties

Deadlocks (dead states) which correspond to a solution can be identified by: sum over all places $T_{i,j} = 1$, or counter=0. All places are covered by 1-P-invariants, except the counter place. All nets enjoy some symmetries.

---

(b) special deadlocks (dead states) correspond to the solutions we are looking for; confirmed at MCC’2014 by Lola and Tapaal on all 6 instances.

c) computed at MCC’2014 by Marcie, PNMC, and PNXDD; exact value: 16,098,428.

t) computed at MCC’2014 by Marcie; exact value: 213,958,152.

(u) computed at MCC’2014 by Marcie and PNMC.

(v) number of initial tokens, because the net is sub-conservative.

(w) number of initial tokens, because the net is sub-conservative.

(x) number of initial tokens, because the net is sub-conservative.

(y) number of initial tokens, because the net is sub-conservative.

(z) number of initial tokens, because the net is sub-conservative.

(aa) number of initial tokens, because the net is sub-conservative.
